

Functional requirement for student registration system: The system shall provide functionality for students to add and drop courses from their schedules in a secure and efficient manner.

Non-Functional requirement for student registration system: The system's database shall be protected by an application programming interface (API), ensuring that modifications cannot be applied directly to the database without proper validation and authorization.

Functional requirement for online store :

- 1- The system shall provide a clear and accessible interface for users to track the delivery status of their shipments.
- 2- The system shall support a fully functional sign-up and sign-out process to manage user accounts securely.

Non Functional requirement for online store:

- 1- The online store shall be safeguarded against Distributed Denial of Service (DDoS) attacks through the implementation of rate limiting mechanisms.
- 2- The deployment infrastructure of the online store shall include a load balancer to distribute traffic evenly across multiple servers, ensuring system reliability and scalability.
